Math 3280 Assignment 11, due Friday, April 25th.
This assignment covers material from section 7.4 and chapter 10.

(1) Compute the Laplace transform of the function

$$v(t) = \begin{cases} 1 \text{ for } t \in [0,1] \\ 0 \text{ for } t \in [-\infty, 0) \text{ and } t \in (1, \infty] \end{cases}$$

directly from the definition $\mathcal{L}(v) = \int_0^\infty e^{-st} v(t) dt$.

(2) Use the Laplace transform method to solve the initial value problem $x'' - x' - 2x = 0$, $x(0) = 0$, $x'(0) = 1$.

(3) Compute the Laplace transform of the sawtooth function $f(t) = t - \lfloor t \rfloor$ where $\lfloor t \rfloor$ is the *floor* function. The floor of t is the largest integer less than or equal to t. For example, $\lfloor 2.6 \rfloor = 2$.

For the next three problems, consider two blocks of mass m_1 and m_2 connected by springs to each other and to walls as shown below. The displacement of the masses from their equilibrium positions are denoted by x_1 and x_2. The stiffness of the three springs are k_1, k_2, and k_3 as shown. Compute the natural frequencies and describe the natural modes of oscillation in each of the three following cases:

(4) $k_1 = k_2 = 4$ and $k_3 = 2$, and $m_1 = 2$, $m_2 = 1$.

(5) $k_1 = k_3 = 1$ and $k_2 = 4$, and $m_1 = m_2 = 1$.

(6) $k_1 = k_3 = 0$ and $k_2 = 4$, and $m_1 = m_2 = 1$.
