External Sorting Chapter 13 Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke 1

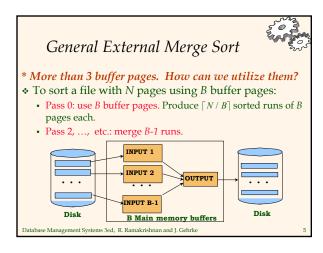

Why Sort?

- * A classic problem in computer science!
- Data requested in sorted order
 - e.g., find students in increasing *gpa* order
- ❖ Sorting is first step in *bulk loading* B+ tree index.
- Sorting useful for eliminating duplicate copies in a collection of records (Why?)
- Sort-merge join algorithm involves sorting.
- * Problem: sort 1Gb of data with 1Mb of RAM.
 - why not virtual memory?

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Cost of External Merge Sort

- * Number of passes: $1 + \lceil \log_{B-1} \lceil N / B \rceil \rceil$
- * Cost = 2N * (# of passes)
- ❖ E.g., with 5 buffer pages, to sort 108 page file:
 - Pass 0: \[108 / 5 \] = 22 sorted runs of 5 pages each (last run is only 3 pages)
 - Pass 1: \[22 / 4 \] = 6 sorted runs of 20 pages each (last run is only 8 pages)
 - Pass 2: 2 sorted runs, 80 pages and 28 pages
 - Pass 3: Sorted file of 108 pages

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Number of Passes of External Sort

N	B=3	B=5	B=9	B=17	B=129	B=257
100	7	4	3	2	1	1
1,000	10	5	4	3	2	2
10,000	13	7	5	4	2	2
100,000	17	9	6	5	3	3
1,000,000	20	10	7	5	3	3
10,000,000	23	12	8	6	4	3
100,000,000	26	14	9	7	4	4
1,000,000,000	30	15	10	8	5	4

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Internal Sort Algorithm

- * Quicksort is a fast way to sort in memory.
- An alternative is "tournament sort" (a.k.a. "heapsort")
 - Top: Read in B blocks
 - Output: move smallest record to output buffer
 - Read in a new record r
 - insert r into "heap"
 - if r not smallest, then GOTO Output
 - else remove *r* from "heap"
 - output "heap" in order; GOTO Top

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

More on Heapsort

- ❖ Fact: average length of a run in heapsort is 2*B*
 - The "snowplow" analogy
- * Worst-Case:
 - What is min length of a run?
 - How does this arise?
- * Best-Case:
 - What is max length of a run?
 - How does this arise?
- Quicksort is faster, but ...

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

I/O for External Merge Sort

- ... longer runs often means fewer passes!
- ❖ Actually, do I/O a page at a time
- ❖ In fact, read a **block** of pages sequentially!
- Suggests we should make each buffer (input/output) be a block of pages.
 - But this will reduce fan-out during merge passes!
 - In practice, most files still sorted in 2-3 passes.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Number of Passes of Optimized Sort

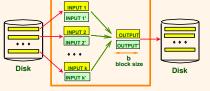

N	B=1,000	B=5,000	B=10,000
100	1	1	1
1,000	1	1	1
10,000	2	2	1
100,000	3	2	2
1,000,000	3	2	2
10,000,000	4	3	3
100,000,000	5	3	3
1,000,000,000	5	4	3

* Block size = 32, initial pass produces runs of size 2B.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Double Buffering

- To reduce wait time for I/O request to complete, can *prefetch* into `shadow block'.
 - Potentially, more passes; in practice, most files <u>still</u> sorted in 2-3 passes.

B main memory buffers, k-way merge

Sorting Records!

- Sorting has become a blood sport!
 - · Parallel sorting is the name of the game ...
- Datamation: Sort 1M records of size 100 bytes
 - Typical DBMS: 15 minutes
 - World record: 3.5 seconds
 - 12-CPU SGI machine, 96 disks, 2GB of RAM
- New benchmarks proposed:
 - Minute Sort: How many can you sort in 1 minute?
 - Dollar Sort: How many can you sort for \$1.00?

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Using B+ Trees for Sorting

- ❖ Scenario: Table to be sorted has B+ tree index on sorting column(s).
- * Idea: Can retrieve records in order by traversing leaf pages.
- * Is this a good idea?
- * Cases to consider:
 - B+ tree is clustered
 - B+ tree is not clustered

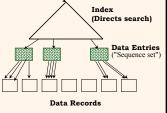

Good idea!

Could be a very bad idea!

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Clustered B+ Tree Used for Sorting

- Cost: root to the leftmost leaf, then retrieve all leaf pages (Alternative 1)
- * If Alternative 2 is used? Additional cost of retrieving data records: each page fetched just once.

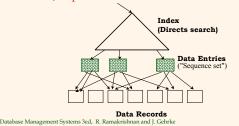

* Always better than external sorting!

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Unclustered B+ Tree Used for Sorting

* Alternative (2) for data entries; each data entry contains rid of a data record. In general, one I/O per data record!

External Sorting vs. Unclustered Index

N	Sorting	p=1	p=10	p=100
100	200	100	1,000	10,000
1,000	2,000	1,000	10,000	100,000
10,000	40,000	10,000	100,000	1,000,000
100,000	600,000	100,000	1,000,000	10,000,000
1,000,000	8,000,000	1,000,000	10,000,000	100,000,000
10,000,000	80,000,000	10,000,000	100,000,000	1,000,000,000

- * p: # of records per page
- * B=1,000 and block size=32 for sorting
- * p=100 is the more realistic value.

 Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

Summary

- * External sorting is important; DBMS may dedicate part of buffer pool for sorting!
- External merge sort minimizes disk I/O cost:
 - Pass 0: Produces sorted *runs* of size *B* (# buffer pages). Later passes: merge runs.
 - # of runs merged at a time depends on B, and block size.
 - · Larger block size means less I/O cost per page.
 - Larger block size means smaller # runs merged.
 - In practice, # of runs rarely more than 2 or 3.

Database Management Systems 3ed, R. Ramakrishnan and J. Gehrke

- Choice of internal sort algorithm may matter:
 - Quicksort: Quick!
 - Heap/tournament sort: slower (2x), longer runs
- The best sorts are wildly fast:
 - Despite 40+ years of research, we're still improving!
- Clustered B+ tree is good for sorting; unclustered tree is usually very bad.
