Genetic Algorithms

- Evolutionary computation
- Prototypical GA
- An example: GABIL
- Genetic Programming
- · Individual learning and population evolution

CS 5751 Machine Learning

Chapter 9 Genetic Algorithms

Evolutionary Computation

- 1. Computational procedures patterned after biological evolution
- 2. Search procedure that probabilistically applies search operators to a set of points in the search
- · Also popular with optimization folks

CS 5751 Machine Learning

Chapter 9 Genetic Algorithms

Biological Evolution

Lamarck and others:

· Species "transmute" over time

Darwin and Wallace:

- · Consistent, heritable variation among individuals in population
- Natural selection of the fittest

Mendel and genetics:

- · A mechanism for inheriting traits
- Genotype → Phenotype mapping

CS 5751 Machine Learning

Chapter 9 Genetic Algorithms

Genetic Algorithm

GA(Fitness, FitnessThreshold, p, r, m)

- Initialize: P ← p random hypotheses
- Evaluate: for each h in P, compute Fitness(h)
- While [max_h, Fitness(h)] < FitnessThreshold

1. Select: probabilistically select (1-r)p members of P to add to P.

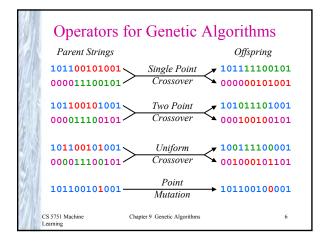

$$Pr(h_i) = \frac{Fitness(h_i)}{\sum_{j=1}^{p} Fitness(h_j)}$$

- 2. Crossover: Probabilistically select pairs of hypotheses from P. For each pair $\langle h_1, h_2 \rangle$, produce two offspring by applying the Crossover operator. Add all offspring to P.
- 3. Mutate: invert a randomly selected bit in mp random members of Ps $4.Update: P \leftarrow P_{\bullet}$
- 5. Evaluate: for each h in P, compute Fitness(h)

Return the hypothesis from P that has the highest fitness

CS 5751 Machine Chapter 9 Genetic Algorithms

Representing Hypotheses Represent $(Type=Car \lor Minivan) \land (Tires = Blackwall)$ by Type Tires 011 10 Represent IF (Type = SUV) THEN (NiceCar = yes)by NiceCar Tires Type 100 10 CS 5751 Machine Chapter 9 Genetic Algorithms

Selecting Most Fit Hypothesis

Fitness proportionate selection:

$$\Pr(h_i) = \frac{Fitness(h_i)}{\sum_{j=1}^{p} Fitness(h_j)}$$

... can lead to crowding

Tournament selection:

- Pick h_1 , h_2 at random with uniform probability
- With probability p, select the more fit

Rank selection:

- · Sort all hypotheses by fitness
- Probability of selection is proportional to rank

CS 5751 Machine

Chapter 9 Genetic Algorithms

GABIL (DeJong et al. 1993)

Learn disjunctive set of propositional rules, competitive with C4.5

Fitness:

 $Fitness(h) = (correct(h))^2$

Representation:

```
IF a_1=T\land a_2=F THEN c=T; if a_2=T THEN c = F represented by
```

Genetic operators: ???

- · want variable length rule sets
- · want only well-formed bitstring hypotheses

CS 5751 Machine Learning Chapter 9 Genetic Algorithms

Crossover with Variable-Length Bitstrings

Start with

- 1. Choose crossover points for h1, e.g., after bits 1,8 h₁: 1[0 01 1 11 1]0 0
- 2. Now restrict points in h2 to those that produce bitstrings with well-defined semantics, e.g.,

<1,3>, <1,8>, <6,8> If we choose <1.3>:

 $h_2: 0[1 \ 1]1 \ 0 \ 10 \ 01 \ 0$

Result is:

CS 5751 Machine

Chapter 9 Genetic Algorithms

GABIL Extensions

Add new genetic operators, applied probabilistically

- 1. *AddAlternative*: generalize constraint on a_i by changing a 0 to 1
- 2. *DropCondition*: generalize constraint on a_i by changing every 0 to 1

And, add new field to bit string to determine whether to allow these:

So now the learning strategy also evolves!

CS 5751 Machine

Chapter 9 Genetic Algorithms

GABIL Results

Performance of GABIL comparable to symbolic rule/tree learning methods C4.5, ID5R, AQ14

Average performance on a set of 12 synthetic problems:

- GABIL without AA and DC operators: 92.1% accuracy
- GABIL with AA and DC operators: 95.2% accuracy
- Symbolic learning methods ranged from 91.2% to 96.6% accuracy

CS 5751 Machine

Chapter 9 Genetic Algorithms

11

Schemas

How to characterize evolution of population in GA? Schema=string containing 0, 1, * ("don't care")

- Typical schema: 10**0*
- Instances of above schema: 101101, 100000, ...

Characterize population by number of instances representing each possible schema

• m(s,t)=number of instances of schema s in population at time t

CS 5751 Machine

Chapter 9 Genetic Algorithms

Consider Just Selection

- $\bar{f}(t)$ = average fitness of population at time t
- m(s,t) = instances of schema s in population at time t
- $\hat{u}(s,t)$ = average fitness of instances of s at time t

Probability of selecting h in one selection step

$$\Pr(h) = \frac{f(h)}{\sum_{i=1}^{n} f(h_i)} = \frac{f(h)}{n\bar{f}(t)}$$

Probability of selecting an instances of s in one step

$$\Pr(h \in s) = \sum_{h \in s \cap p_t} \frac{f(h)}{n\bar{f}(t)} = \frac{\hat{u}(s,t)}{n\bar{f}(t)} m(s,t)$$

Expected number of instances of s after n selections

$$E[m(s,t+1)] = \frac{\hat{u}(s,t)}{\bar{f}(t)}m(s,t)$$

CS 5751 Machine Learning

Chapter 9 Genetic Algorithms

Schema Theorem

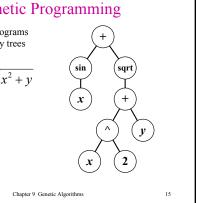

$$E[m(s,t+1)] \ge \frac{\hat{u}(s,t)}{\bar{f}(t)} m(s,t) \left(1 - p_c \frac{d(s)}{l-1}\right) (1 - p_m)^{o(s)}$$

- m(s,t) = instances of schema s in population at time t
- $\bar{f}(t)$ = average fitness of population at time t
- $\hat{u}(s,t)$ = average fitness of instances of s at time t
- p_c = probability of single point crossover operator
- p_m = probability of mutation operator
- l =length of single bit strings
- o(s) = number of defined (non "*") bits in s
- d(s) = distnace between left-, right most defined bits in s

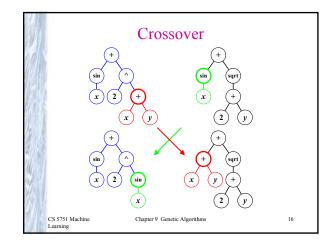

CS 5751 Machine

Chapter 9 Genetic Algorithms

Genetic Programming Population of programs represented by trees Example: $\sin(x) + \sqrt{x^2 + y}$

13

Block Problem

Goal: spell UNIVERSAL

- CS ("current stack") = name of top block on stack, or False
- TB ("top correct block") = name of topmost correct block on stack
- NN ("next necessary") = name of next block needed above TB in the stack

CS 5751 Machine

Chapter 9 Genetic Algorithms

Block Problem Primitives

Primitive functions:

- (MS x): ("move to stack"), if block x is on the table, moves x to the top of the stack and returns True. Otherwise, does nothing and returns False
- (MT x): ("move to table"), if block x is somewhere in the stack, moves the block at the top of the stack to the table and returns True. Otherwise, returns False
- (EQ x y): ("equal"), returns True if x equals y, False
- (NOT x): returns True if x = False, else return False
- (DU x y): ("do until") executes the expression x repeatedly until expression y returns the value True

CS 5751 Machine

Chapter 9 Genetic Algorithms

Learned Program

Trained to fit 166 test problems

Using population of 300 programs, found this after 10 generations:

```
(EQ (DU (MT CS) (NOT CS))
(DU (MS NN) (NOT NN)))
```

CS 5751 Machine

Chapter 9 Genetic Algorithms

19

More interesting example: design electronic filter circuits

Genetic Programming

- Individuals are programs that transform the beginning circuit to a final circuit by adding/subtracting components and connections
- Use population of 640,000, run on 64 node parallel process
- Discovers circuits competitive with best human designs

CS 5751 Machine Learning Chapter 9 Genetic Algorithms

20

22

GP for Classifying Images

Fitness: based on coverage and accuracy

Representation:

- Primitives include Add, Sub, Mult, Div, Not, Max, Min, Read, Write, If-Then-Else, Either, Pixel, Least, Most, Ave, Variance, Difference, Mini, Library
- Mini refers to a local subroutine that is separately coevolved
- Library refers to a global library subroutine (evolved by selecting the most useful minis)

Genetic operators:

- · Crossover, mutation
- Create "mating pools" and use rank proportionate reproduction

CS 5751 Machine

Chapter 9 Genetic Algorithms

Biological Evolution

Lamarck (19th century)

- Believed individual genetic makeup was altered by lifetime experience
- · Current evidence contradicts this view

What is the impact of individual learning on population evolution?

CS 5751 Machine Learning Chapter 9 Genetic Algorithms

Baldwin Effect

Assume

- Individual learning has no direct influence on individual DNA
- But ability to learn reduces the need to "hard wire" traits in DNA

Then

- Ability of individuals to learn will support more diverse gene pool
 - Because learning allows individuals with various "hard wired" traits to be successful
- More diverse gene pool will support faster evolution of gene pool
- →individual learning (indirectly) increases rate of evolution

 CS 5751 Machine
 Chapter 9 Genetic Algorithms
 Chapter 9 Genetic Algorithms

Baldwin Effect (Example)

Plausible example:

- 1. New predator appears in environment
- 2. Individuals who can learn (to avoid it) will be selected
- 3. Increase in learning individuals will support more diverse gene pool
- 4. Resulting in faster evolution
- 5. Possibly resulting in new non-learned traits such as instinctive fear of predator

CS 5751 Machine

Chapter 9 Genetic Algorithms

Computer Experiments on Baldwin Effect

Evolve simple neural networks:

- · Some network weights fixed during lifetime, others trainable
- Genetic makeup determines which are fixed, and their weight values

- · With no individual learning, population failed to improve
- · When individual learning allowed
 - Early generations: population contained many individuals with many trainable weights
 - Later generations: higher fitness, white number of trainable weights decreased

CS 5751 Machine

Chapter 9 Genetic Algorithms

Bucket Brigade

- Evaluation of fitness can be very indirect
 - consider learning rule set for multi-step decision
 - bucket brigade algorithm:
 - · rule leading to goal receives reward
 - · that rule turns around and contributes some of its reward to its
 - no issue of assigning credit/blame to individual steps

CS 5751 Machine Learning

Chapter 9 Genetic Algorithms

26

Evolutionary Programming Summary

- Approach learning as optimization problem (optimizes fitness)
- · Concepts as chromosomes
 - representation issues:
 - · near values should have near chromosomes (grey
 - · variable length encodings (GABIL, Genetic Programming)
- Genetic algorithm (GA) basics
 - population
 - fitness function
- fitness proportionate reproduction
 CS 5751 Machine Chapter 9 Genetic Algorithms

Evolutionary Programming Summary

- Genetic algorithm (GA) basics
 - reproduction operators
 - · crossover
 - · single, multi, uniform
 - · mutation
 - · application specific operators
- Genetic Programming (GP)
 - programs as trees
 - genetic operations applied to pairs of trees

CS 5751 Machine

Evolutionary Programming Summary

- Other evolution issues
 - adaptation of chromosome during lifetime (Lamarck)
 - Baldwin effect (ability to learn indirectly supports better populations)
- · Schema theorem
 - good ideas are schemas (some features set, others *)
 - over time good schemas are concentrated in population
