Kenneth Johansson lives in Southern Sweden near where they mine the stone known as dolomite. This stone is a dense, heavy, black stone that many sculptors love to use because it can be rough or shiny smooth, depending upon how it is cut and finished.

As a sculptor, Johansson gets his ideas from the well-crafted forms of functional objects, like this sled.

What did the artist do to transform the sled into a sculpture?

What other materials could be used to create a similar work of art?

Create your own "functional object" sculpture. Transform the object in some way.
