

# Relational Calculus

## Chapter 4, Part B

# Relational Calculus

- ❖ Comes in two flavors: Tuple relational calculus (TRC) and Domain relational calculus (DRC).
- ❖ Calculus has *variables*, *constants*, *comparison ops*, *logical connectives* and *quantifiers*.
  - TRC: Variables range over (i.e., get bound to) *tuples*.
  - DRC: Variables range over *domain elements* (= field values).
  - Both TRC and DRC are simple subsets of first-order logic.
- ❖ Expressions in the calculus are called *formulas*. An answer tuple is essentially an assignment of constants to variables that make the formula evaluate to *true*.

# Domain Relational Calculus

- ❖ *Query* has the form:  
$$\langle x_1, x_2, \dots, x_n \rangle \mid p(\langle x_1, x_2, \dots, x_n \rangle)$$
- ❖ *Answer* includes all tuples  $\langle x_1, x_2, \dots, x_n \rangle$  that make the *formula*  $p(\langle x_1, x_2, \dots, x_n \rangle)$  be *true*.
- ❖ *Formula* is recursively defined, starting with simple *atomic formulas* (getting tuples from relations or making comparisons of values), and building bigger and better formulas using the *logical connectives*.

# DRC Formulas

- ❖ *Atomic formula*:
  - $\langle x_1, x_2, \dots, x_n \rangle \in Rname$ , or  $X op Y$ , or  $X op constant$
  - *op* is one of  $<, >, =, \leq, \geq, \neq$
- ❖ *Formula*:
  - an atomic formula, or
  - $\neg p, p \wedge q, p \vee q$ , where  $p$  and  $q$  are formulas, or
  - $\exists X(p(X))$ , where variable  $X$  is *free* in  $p(X)$ , or
  - $\forall X(p(X))$ , where variable  $X$  is *free* in  $p(X)$
- ❖ The use of *quantifiers*  $\exists X$  and  $\forall X$  is said to *bind*  $X$ .
  - A variable that is *not bound* is *free*.

# Free and Bound Variables

- ❖ The use of *quantifiers*  $\exists X$  and  $\forall X$  in a formula is said to *bind*  $X$ .
  - A variable that is *not bound* is *free*.
- ❖ Let us revisit the definition of a *query*:  
$$\langle x_1, x_2, \dots, x_n \rangle \mid p(\langle x_1, x_2, \dots, x_n \rangle)$$
- ❖ There is an important restriction: the variables  $x_1, \dots, x_n$  that appear to the left of  $\langle \rangle$  must be the *only* free variables in the formula  $p(\dots)$ .

# Find all sailors with a rating above 7

$$\langle I, N, T, A \rangle \mid \langle I, N, T, A \rangle \in Sailors \wedge T > 7$$

- ❖ The condition  $\langle I, N, T, A \rangle \in Sailors$  ensures that the domain variables  $I, N, T$  and  $A$  are bound to fields of the same *Sailors* tuple.
- ❖ The term  $\langle I, N, T, A \rangle$  to the left of  $\langle \rangle$  (which should be read as *such that*) says that every tuple  $\langle I, N, T, A \rangle$  that satisfies  $T > 7$  is in the answer.
- ❖ Modify this query to answer:
  - Find sailors who are older than 18 or have a rating under 9, and are called 'Joe'.

Find sailors rated > 7 who've reserved boat #103

$$\{ \langle I, N, T, A \rangle \mid \langle I, N, T, A \rangle \in \text{Sailors} \wedge T > 7 \wedge \\ \exists Ir, Br, D \{ \langle Ir, Br, D \rangle \in \text{Reserves} \wedge Ir = I \wedge Br = 103 \} \}$$

- ❖ We have used  $\exists Ir, Br, D (\dots)$  as a shorthand for  $\exists Ir (\exists Br (\exists D (\dots)))$
- ❖ Note the use of  $\exists$  to find a tuple in Reserves that 'joins with' the Sailors tuple under consideration.

Find sailors rated > 7 who've reserved a red boat

$$\{ \langle I, N, T, A \rangle \mid \langle I, N, T, A \rangle \in \text{Sailors} \wedge T > 7 \wedge \\ \exists Ir, Br, D \{ \langle Ir, Br, D \rangle \in \text{Reserves} \wedge Ir = I \wedge \\ \exists B, BN, C \{ \langle B, BN, C \rangle \in \text{Boats} \wedge B = Br \wedge C = 'red' \} \} \}$$

- ❖ Observe how the parentheses control the scope of each quantifier's binding.
- ❖ This may look cumbersome, but with a good user interface, it is very intuitive. (MS Access, QBE)

Find sailors who've reserved all boats

$$\{ \langle I, N, T, A \rangle \mid \langle I, N, T, A \rangle \in \text{Sailors} \wedge \\ \forall B, BN, C \{ \neg \{ \langle B, BN, C \rangle \in \text{Boats} \} \vee \\ \{ \exists Ir, Br, D \{ \langle Ir, Br, D \rangle \in \text{Reserves} \wedge I = Ir \wedge Br = B \} \} \}$$

- ❖ Find all sailors  $I$  such that for each 3-tuple  $\langle B, BN, C \rangle$  either it is not a tuple in Boats or there is a tuple in Reserves showing that sailor  $I$  has reserved it.

Find sailors who've reserved all red boats (again)

$$\{ \langle I, N, T, A \rangle \mid \langle I, N, T, A \rangle \in \text{Sailors} \wedge \\ \forall \langle B, BN, C \rangle \in \text{Boats} \\ \{ \exists \langle Ir, Br, D \rangle \in \text{Reserves} \{ I = Ir \wedge Br = B \} \}$$

- ❖ Simpler notation, same query. (Much clearer!)
- ❖ To find sailors who've reserved all red boats:

$$\dots \{ C \neq 'red' \vee \exists \langle Ir, Br, D \rangle \in \text{Reserves} \{ I = Ir \wedge Br = B \} \}$$

## Unsafe Queries, Expressive Power

- ❖ It is possible to write syntactically correct calculus queries that have an infinite number of answers! Such queries are called *unsafe*.
  - e.g.,  $\{ S \mid \neg \{ S \in \text{Sailors} \} \}$
- ❖ It is known that every query that can be expressed in relational algebra can be expressed as a safe query in DRC / TRC; the converse is also true.
- ❖ **Relational Completeness:** Query language (e.g., SQL) can express every query that is expressible in relational algebra/calculus.

## Summary

- ❖ Relational calculus is non-operational, and users define queries in terms of what they want, not in terms of how to compute it. (Declarativeness.)
- ❖ Algebra and safe calculus have same expressive power, leading to the notion of relational completeness.
